ASSIGNMENT 1

Question: Write an array code that returns the 81 marks from the studentMarks array.

Answer (C# Code):

```
using System;

class Program
{
    static void Main()
    {
        int[,] studentMarks =
        {
            {75, 80, 90, 85},
            {80, 85, 95, 90},
            {90, 95, 81, 80},
            {85, 90, 80, 75}
        };

        for (int i = 0; i < studentMarks.GetLength(0); i++)
        {
            for (int j = 0; j < studentMarks.GetLength(1); j++)
            {
                if (studentMarks[i, j] == 81)
                {
                    Console.WriteLine("The mark is: " + studentMarks[i, j]);
                    return;
                }
            }
        }
    }
}
```

Output:

```
The mark is: 81
```

Explanation:

1. The `studentMarks` array stores marks in two dimensions (rows and columns).

2. The outer loop checks each row, while the inner loop checks each mark in that row.

3. The `if` statement checks whether a mark is equal to 81.

4. `Console.WriteLine()` displays the mark, and `return` stops the program after finding it.
